IHSA Project Guide

What is this project?

IHSA stands for **Intelligent Healthcare Support Agent**. It's a website with a helpful assistant for health insurance questions.

Health insurance can be confusing. People want to know what their plan pays for, what happened to a claim, and which papers they need. Getting those answers usually means reading long documents or waiting for a support person.

IHSA makes this easier. A person signs in and asks a question in normal words. The assistant finds the answer from their own records or the plan documents, and shows where the answer came from. If it isn't sure, it doesn't guess. It offers to pass the question to a support person.

I built this as an internship case study for Evernorth. It's a practice project, not a real Evernorth product, and all the people, plans and claims in it are made up.

What can it do?

- **Answer questions** about plans, costs and claims
- **Read uploaded documents**, including handwritten prescriptions
- **Check paperwork** to see if a prior authorization request has everything it needs
- **Reply in three languages:** English, Telugu and Hindi
- **Hand over to a person** when it can't help

Prior authorization means asking the insurance plan to review a treatment before the patient gets it.

The four roles

Everyone signs in, and each person sees only the screens for their role.

Role	Who they are	Main job
Member	A customer with a health plan	Gets help with their own plan and claims
Provider	Doctor's office or clinic staff	Prepares paperwork for treatments
Support agent	A customer support worker	Solves problems the assistant can't

Role	Who they are	Main job
Admin	The person who runs the system	Manages users and watches how it's working

What each role does

Member

- Asks the assistant questions, such as "What is my deductible?"
- Checks their claims and why a claim was paid or denied
- Sees what their plan pays for and what they have to pay
- Reads the plan documents to check an answer
- Uploads documents and asks about them
- Opens a support case to get help from a person

Provider

- Uses their own workspace and the assistant
- Looks up plan benefits and plan documents
- Uploads a patient's paperwork
- Checks if a prior authorization request is complete
- Sees what is missing before sending it
- Opens support cases when they need help

The check only shows if the paperwork is complete. It never approves or denies a treatment.

Support agent

- Sees the list of waiting support cases
- Picks up a case and works on it
- Reads the claims and documents linked to that case
- Looks up plan benefits and plan documents
- Updates the case until the problem is solved

The agent doesn't start from zero, because the case includes a short summary of what the customer asked.

Admin

- Adds new members, providers and support agents
- Sees how many questions and cases the system is handling
- Finds questions the assistant couldn't answer
- Gives support cases to agents
- Checks the activity log to see what happened in the system

Example: how it all works together

1. **Member:** Priya asks about her claim, and the assistant can't fully solve her problem.
2. **Member:** Priya agrees to open a support case.
3. **Support agent:** Sam picks up the case, reads the summary and helps Priya.
4. **Admin:** Alex can see the case in the totals, and can give it to a different agent if needed.

Good to know

The assistant helps people find information, but it isn't a doctor or an insurance officer. It doesn't give medical advice, and it never approves or denies treatment. A real person makes those decisions.
